

METHOD OF ASSEMBLING STARTER LEAD WIRE

CROSS REFERENCE TO RELATED APPLICATION

This application relates to and incorporates herein by
5 reference Japanese Patent Application No. 2001-56795 filed on March
1, 2001.

FIELD OF THE INVENTION

The present invention relates to a method of assembling a
10 lead wire of a starter to facilitate assembling of the starter.

BACKGROUND OF THE INVENTION

In recent years, with downsizing of a starter, heat generation
15 per unit area during starter operation is increased. Therefore,
it is required to improve heat radiation of the starter. To meet
this requirement, for example, the lead wire electrically connecting
an outside and inside of a housing of a starting motor is designed
20 thicker and shorter.

In a starter proposed in JP-A-2-278612, a rubber sleeve is
25 air-tightly integrated with the lead wire by insert molding. Also,
the outer periphery of the rubber sleeve is sealed with a housing
to maintain waterproofness between the rubber sleeve and the housing.
In this starter, the lead wire integrated with the rubber sleeve
is connected to a predetermined position by manually bending.
However, it is difficult to manually bend the thickened and shortened
lead wire, and as a result, assemblability of the starter is lessened.
Further, the rubber sleeve around the lead wire tends to be deformed

by stress caused by bending the lead wire. Therefore, the sealing structure between the rubber sleeve and the housing is likely to be deformed, and as a result, the waterproofness is worsened.

5

SUMMARY OF THE INVENTION

The present invention is made in view of the above problem and it is an object to provide an assembling method of a lead wire of a starter to facilitate an assembly of the starter.

In the drawings:

FIG. 1 is a partial external view of a starting motor according to a first embodiment of the present invention;

5 FIG. 2 is a partial cross-sectional view of a lead wire connecting a magnet switch and a starting motor taken along line II-II of FIG. 1;

FIG. 3 is a partial cross-sectional view of a sealing portion taken along line III-III of FIG. 1;

FIG. 4 is a partial perspective view illustrating positional relationship of a yoke and an end frame of the starting motor according to the first embodiment;

FIG. 5 is an enlarged perspective view of a sleeve integrating an O-ring according to a second embodiment of the present invention;

FIG. 6 is a cross-sectional view of a sleeve taken perpendicularly to an extending direction of the sleeve according to a third embodiment of the present invention;

FIG. 7 is a cross-sectional view of a sleeve according to a fourth embodiment of the present invention.

10046476.011602

20

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

(First Embodiment)

25

As shown in FIGS. 1 and 2, a starting motor 1 is connected to a magnet switch 9 adjacently provided thereto. The magnet switch 9 is to turn on/off the electric current supply from a battery (not shown) to the starting motor 1.

The lead wire 2 includes a connecting portion 2a at one end formed by welding twisted copper wires of the lead wire 2. The other

end of the lead wire 2 is welded to a terminal 2b. The lead wire 2 is bent into a generally V-shape beforehand so as to form a first bent portion 21 including the connecting portion 2a and a second bent portion 22 including the terminal 2b. A bolt 10 is provided
5 at one axial side of the fixed contact posts of the magnet switch 9. The terminal 2b is connected to the bolt 10 by tightening a nut 11 with the bolt 10. A yoke 7 as a housing of the starting motor 1 includes a connecting bar (not shown) connected to field windings (not shown) therein. The connecting portion 2a is connected to the connecting bar by brazing. The lead wire 2 is inserted in a sleeve
10 3 which insulates the lead wire 2 and prevents entering of water into the starting motor 1.

The sleeve 3 is made of an insulation material such as rubber. The sleeve 3 is formed by molding and integrated with the lead wire 2 after the lead wire 2 is bent to a predetermined shape shown in FIG. 2 beforehand. In the predetermined shape, the lead wire 2 connects the starting motor 1 and the magnet switch 9 in a shortest distance, and the terminal 2b of the second bent portion 22 is in parallel with a fixing surface of the bolt 10. At this time, the
15 sleeve 3 fluid-tightly contacts the second bent portion 22 and the terminal 2b. The sleeve 3 includes a thin wall portion 3b at a part that faces the first bent portion 21. The thin wall portion 3b is thinner than the other parts of the sleeve 3. A clearance 4 remains in a substantially cylindrical-shape between the first bent portion
20 21 of the lead wire 2 and the thin wall portion 3b of the sleeve 3. As shown in FIG. 2, a seal portion 3a is provided on the outer periphery of the sleeve 3 at a position that faces the end portion

H0046176 * 04602

of the first bent portion 21, in order to prevent entering of water
into the starting motor 1. The seal portion 3a has a groove so as
to engage with insertion portions 7a and 8a (described later) of
the yoke 7 and an end frame 8. Thus, the sleeve 3 is fluid-tightly
5 fixed to the yoke 7 and the end frame 8, as shown in FIGS. 1 and
3.

The terminal 2b includes a through hole 2c. When the sleeve
3 is assembled to the yoke 7 and the end frame 8 through the seal
portion 3a, the through hole 2c of the terminal 2b is engaged with
10 the bolt 10 of the magnet switch 9. In this way, the lead wire 2
is readily connected to the magnet switch 9 in the course of assembling
of the starting motor 1. Since the sleeve 3 is fluid-tightly fixed
to the terminal 2b, it is prevented that water enters the sleeve
3 from this fixing part of the sleeve 3 and the terminal 2b. While
15 assembling of the starting motor 1, for example, if the magnet switch
9 is displaced, it is necessary to slightly adjust the shape of
the lead wire 2. At this time, the sleeve 3 is deformed. In this
case, because the clearance 4 is provided in the inner periphery
of the thinner wall portion 3b, the thin wall portion 3b is mainly
20 deformed, but the seal portion 3a is not generally deformed. Thus,
the deformation of the seal portion 3a is decreased by the clearance
4. Therefore, the seal portion 3a can maintain waterproofness.

The yoke 7 and the end frame 8 form a cylindrical housing
and accommodate the field windings (not shown) and an armature (not
25 shown) of the starting motor 1 therein. As shown in FIGS. 3 and
4, the end frame 8 is provided with a spigot portion 8b to engage
with the inner peripheral surface of the yoke 7. The spigot portion

8b includes an annular groove 8c to fit an O-ring 6 on the same axial line as those of the yoke 7 and the end frame 8. The yoke 7 and the end frame 8 include insertion portions 7a and 8a that define a hole to introduce the lead wire 2 in the starting motor 1, respectively. The insertion portions 7a and 8a engage with the seal portion 3a of the sleeve 3 to make the starting motor 1 waterproof. When the yoke 7 is fitted to the end frame 8, the O-ring 6 is press-contacted to the annular groove 8c, the inner peripheral surface of the yoke 7 and the seal portion 3a. Therefore, the yoke 7 and the end frame 8 can be fluid-tightly fitted to each other, thereby maintaining waterproofness therebetween.

A cap 5 is made of rubber or resin. As shown in FIG. 2, the cap 5 is fitted on the outer periphery of the sleeve 3 and engaged with an engaging portion 9a of the magnet switch 9. Therefore, the connecting portion between the magnet switch 9 and the lead wire 2 is covered with the cap 5. Accordingly, the connecting portion between the magnet switch 9 and the lead wire 2 is made waterproof.

The sleeve 3 is molded in the following manner.

First, the terminal 2b is bonded to the lead wire 2 by welding and the like, and the connecting portion 2a is formed by welding. Then, this lead wire 2 is bent into the substantially V-shape as shown in FIG. 2. At this stage, the lead wire 2 is shaped into the completed shape that is substantially the same shape as that in the completion of the assembly of the starting motor 1.

Next, the lead wire 2 is placed in a molding die and rubber is then injected into the molding die. Thus, the sleeve 3 is integrally molded with the lead wire 2. While injection-molding,

10004176.041502

the terminal 2b and the first bent portion 21 of the lead wire 2
are held with the molding die. That is, the lead wire 2 is securely
held in the molding die at two positions including the first bent
portion 21. Therefore, the lead wire 2 is restricted from moving
5 in the molding die due to injection pressure of the rubber during
the rubber injection. As a result, the sleeve 3 is uniformly molded
in thickness. Further, since rubber does not stick to a part that
is held with the molding die, the clearance 4 is provided on the
outer periphery of the first bent portion 21 after removal of the
molding die.

10 The starting motor 1 is assembled in the following manner.

Firstly, each component is set in the following state. The
field windings (not shown), the armature (not shown) and brushes
(not shown) for supplying electric current to the armature are
assembled in the yoke 7. Also, those components are electrically
connected. The seal portion 3a of the sleeve 3 is fixed to the
insertion portion 7a of the yoke 7. The connecting portion 2a of
the lead wire 2 is brazed to the connector bar (not shown) of the
field windings. The cover 5 is attached on the sleeve 3 to cover
20 the terminal 2b of the lead wire 2. The O-ring 6 is attached on
the annular groove 8c of the end frame 8.

Then, the yoke 7 is engaged with the spigot portion 8b of
the end frame 8 while engaging the insertion portion 8a of the end
frame 8 with the seal portion 3a, so that the yoke 7 is contacted
25 to the end frame 8. The yoke 7 is then fixed to the end frame 8
by tightening through bolts (not shown).

Next, the lead wire 2 is connected to the magnet switch 9.

As already described above, the lead wire 2 is bent into the completed shape shown in FIG. 2 beforehand. When the seal portion 3a of the sleeve 3 is assembled to the yoke 7 and the end frame 8, the through hole 2c of the terminal 2b corresponds to the bolt 10 of the magnet switch 9. Therefore, the terminal 2b is readily set to the bolt 10. After fixing the terminal 2b by tightening the nut 11, the connecting portion including the bolt 10, the nut 11 and the terminal 2b and the like are entirely covered with the cap 5. Then, an opening end portion of the cap 5 is engaged with the annular-shaped engaging portion 9a of the magnet switch 9. Therefore, the entering of water to the bolt 10 and the terminal 2b is prevented.

When the terminal 2b is connected to the bolt 10, even if the through hole 2c of the terminal 2b is displaced from the bolt 10 of the magnet switch 9, an amount of the displacement is small. Therefore, the displacement is manually adjusted so that the terminal 2b is connected to the bolt 10. With this manual adjustment, the sleeve 3 tends to deform. However, only the thin wall portion 3b deforms without causing deformation in the seal portion 3a. Therefore, deformation of the seal portion 3a is suppressed. As a result, the entering of water is prevented between the seal portion 3a, the yoke 7 and the end frame 8.

In the starting motor 1 according to the first embodiment, the sleeve 3 is integrally molded with the lead wire 2 after the lead wire 2 is shaped into the completed bent shape. Then, the seal portion 3a of the sleeve 3 is engaged with the insertion portions 7a and 8a of the yoke 7 and the end frame 8. Therefore, it is unnecessary to manually bend the lead wire 2 in order to connect

100-6576-014602

the terminal 2b to the magnet switch 9 like a conventional lead wire, during the assembly of the starting motor 1. As a result, the seal portion 3a is prevented from being deformed, thereby maintaining waterproofness and facilitating assembling of the
5 starting motor 1.

In addition, the lead wire 2 is bent into the V-shape forming the first bent portion 21 including the connecting portion 2a and the second bent portion 22 including the terminal 2b beforehand. Further, the clearance 4 is formed between the first bent portion 21 and the sleeve 3. Therefore, in a case that the lead wire 2 is needed to be slightly bent by manual work in order to adjacent the displacement or the like, the deformation of the sleeve 3 is absorbed by the clearance 4. As a result, the seal portion 3a is not deformed, thereby maintaining waterproofness successfully.

(Second Embodiment)

In a second embodiment, the sleeve 3 is integrally formed with the O-ring 6 as shown in FIG. 5. With this arrangement, similar effects to the first embodiment can be obtained. Further, not only the number of components is decreased, but also the assemblability
20 of the starting motor 1 can be improved.

(Third Embodiment)

In a third embodiment, the sleeve 3 has a projection 3c as shown in FIG. 6 in addition to or in place of the clearance 4. With this arrangement, in a case that the lead wire 2 is slightly bent
25 to adjust the displacement, the deformation of the sleeve 3 is absorbed by the projection 3c. Therefore, the deformation of the seal portion 3a is restricted, thereby maintaining the starting motor 1 to be

waterproof satisfactorily.

(Fourth Embodiment)

In a fourth embodiment, the sleeve 3 has an accordion 3d that faces the first bent portion through the clearance 4, as shown in FIG. 7. Thus, in a case that the lead wire 2 is slightly bent during the assembly of the starting motor 1, the deformation of the sleeve 3 is absorbed by deformation of the accordion 3d. As a result, the deformation of seal portion 3a is restricted, thereby maintaining the starting motor 1 to be waterproof satisfactorily.

In the above embodiments, it is described that the lead wire 2 is bent into the predetermined shape before molding of the sleeve 3. However, the lead wire 2 may be bent after molding of the sleeve 3 and before being fitted to the magnet switch 9 and the starting motor 1. Since the clearance 4 is provided, the waterproofness between the sleeve 3 and the starting motor 1 is maintained.

The present invention should not be limited to the disclosed embodiments, but may be implemented in other ways without departing from the spirit of the invention.
